Who?

The Akira ransomware group is a cybercrime organization that emerged in March 2023. It operates with a primary motive of financial gain. The group primarily targets organizations in the United States and Canada across sectors such as healthcare, finance, education, and manufacturing. The Akira ransomware group aims to gain a strategic advantage by specifically targeting financial institutions and government-related organizations. In Ecuador, targets include critical infrastructure and financial service providers.

What?

Akira employs a double-extortion ransomware model, encrypting victims' data and exfiltrating it. The group demands ransoms ranging from \$200,000 to \$4 million in exchange for decrypting files or refraining from publishing sensitive data. The first version of the Akira ransomware was written in C++ and appended files with the '.akira' extension, creating a ransom note named 'akira_readme.txt,' partially based on the Conti V2 source code.

On July 2, 2023, a version was released that fixed the decryption problem. Since then, the new version has been found to be written in Rust, this time named 'megazord.exe' and changing the extension for the encrypted files to '.powerranges'.

Where?

Initially targeting Windows systems, Akira expanded its operations in April 2023 to include VMware ESXi virtual machines. The group has impacted over 250 organizations worldwide, spanning industries such as services, manufacturing, education, construction, critical infrastructure, finance, healthcare, and legal sectors.

When?

Akira has been active since March 2023 and significantly intensified its attacks throughout 2024, impacting numerous sectors globally.

How?

The Akira ransomware group employs a range of sophisticated techniques:

- Initial Access: Utilizing phishing emails, exploiting vulnerabilities, and using compromised credentials.
- Lateral Movement: Exploiting critical vulnerabilities such as CVE-2024-40766 (SonicWall SonicOS), CVE-2023-20269 (Cisco VPN), and CVE-2023-48788 (FortiClientEMS), CVE-2023-27532 (Veeam Backup & Replication), CVE-2024-40711 (Veam Backup & Replication (VBR) Servers).
- Data Exfiltration: Exfiltrating sensitive information before encryption.
- Robust Encryption: Deploying strong encryption algorithms to ensure the encrypted files are irrecoverable without a decryption key.

Many of Akira's initial access vectors use brute force attempts on Cisco VPN devices (which only use single-factor authentication).

Additionally, the exploitation of CVEs: CVE-2019-6693 and CVE-2022-40684 were detected for first access.

Group Site

akiral2iz6a7qgd3ayp3l6yub7xx2uep76idk3u2kollpj5z3z636bad.onion

The screenshot shows a terminal window with a black background and green text. The title bar at the top reads "[AKIRA]". The main content area displays the word "AKIRA" in large, bold, green capital letters. Below this, a message in green text reads: "Well, you are here. It means that you're suffering from cyber incident right now. Think of our as an unscheduled forced audit of your network for vulnerabilities. Keep in mind that there is a price to make it all go away. Do not rush to assess what is happening - we did it to you. The best you can do is to follow our instructions to get back to your daily routine, by cooperating with us will minimize the damage that might be done. Those who choose different path will be shamed here. The functionality of this blog is extremely simple - enter the desired command in the input line enjoy the juiciest information that corporations around the world wanted to stay confidential. You are unable to recover without our help. Your data is already gone and cannot be traced to the of final storage nor deleted by anyone besides us." Below the message, the prompt "quest@akira:~\$ help" is shown, followed by a list of commands: "leaks - hacked companies", "news - news about upcoming data releases", "contact - send us a message and we will contact you", "help - available commands", and "clear - clear screen". The prompt "quest@akira:~\$" is shown at the bottom.

Xtrim TVCable Attack in Ecuador by Akira

Akira Ransomware Group announced that it attacked Xtrim TVCable on 2024-11-14. The Akira group, which then expected a ransom, published all the data publicly after failing to receive the ransom expectation.

The relevant data included financial data, employees and customers contacts.

Targeted Industries and Countries

Akira's attacks have targeted industries like information technology, finance, education, healthcare. **The group typically infiltrates systems using weak VPN credentials or compromised remote desktop protocols (RDP).**

Graph of the Sectors and Countries targeted by Akira Ransomware the Most

The above graph shows the top 10 industries and top 10 countries targeted by the Akira Ransomware group. The industry most targeted by the Akira Ransomware group is healthcare, and the country most targeted by the group is the United States.

Ransomware Analysis

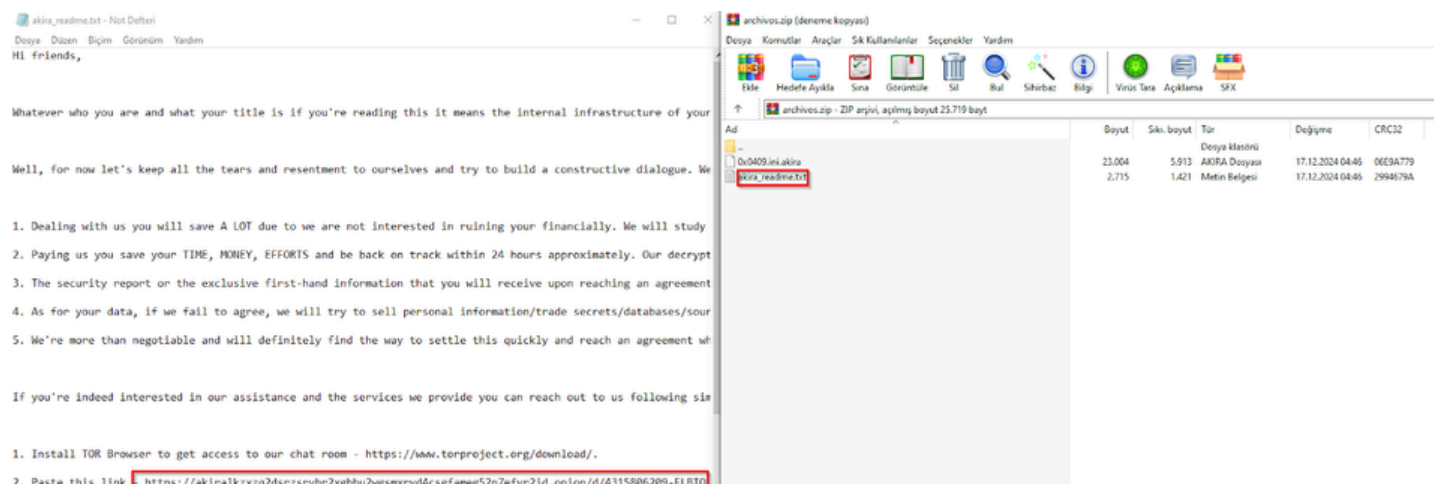

Image of Akira Ransomware Group

Within the compromised system, the extension, the readme file and the content of the file indicate that the group that carried out the attack is the Akira Ransomware group.

Content of the Readme File

Hi friends,

Whatever who you are and what your title is if you're reading this it means the internal infrastructure of your company is fully or partially dead, all your backups - virtual, physical - everything that we managed to reach - are completely removed. Moreover, we have taken a great amount of your corporate data prior to encryption.

Well, for now let's keep all the tears and resentment to ourselves and try to build a constructive dialogue. We're fully aware of what damage we caused by locking your internal sources. At the moment, you have to know:

1. Dealing with us you will save A LOT due to we are not interested in ruining your financially. We will study in depth your finance, bank & income statements, your savings, investments etc. and present our reasonable demand to you. If you have an active cyber insurance, let us know and we will guide you how to properly use it. Also, dragging out the negotiation process will lead to failing of a deal.

2. Paying us you save your TIME, MONEY, EFFORTS and be back on track within 24 hours approximately. Our decryptor works properly on any files or systems, so you will be able to check it by requesting a test decryption service from the beginning of our conversation. If you decide to recover on your own, keep in mind that you can permanently lose access to some files or accidentally corrupt them - in this case we won't be able to help.

3. The security report or the exclusive first-hand information that you will receive upon reaching an agreement is of a great value, since NO full audit of your network will show you the vulnerabilities that we've managed to detect and used in order to get into, identify backup solutions and upload your data.

4. As for your data, if we fail to agree, we will try to sell personal information/trade secrets/databases/source codes - generally speaking, everything that has a value on the darkmarket - to multiple threat actors at ones. Then all of this will be published in our blog - <https://akiral2iz6a7qgd3ayp3l6yub7xx2uep76idk3u2kollpj5z3z636bad.onion>.

5. We're more than negotiable and will definitely find the way to settle this quickly and reach an agreement which will satisfy both of us.

If you're indeed interested in our assistance and the services we provide you can reach out to us following simple instructions:

1. Install TOR Browser to get access to our chat room - <https://www.torproject.org/download/>.

2. Paste this link - <https://akiralkzxxq2dsrzsrivr2xgbbu2wgsmxryd4csgfameg52n7efvr2id.onion/d/4315806209-FLBTQ>

3. Use this code - 1312-FJ-WDQH-PHOW - to log into our chat.

Keep in mind that the faster you will get in touch, the less damage we cause.

Basic Characteristics of Akira Ransomware

Akira ransomware is compiled in C++ language, has a disk space of 1.02MB and the sample is not packed.

File Type	PE64 Windows Executable
Detected Language	C++
File Size	1.02MB
PE Size	1.02MB
Packer	Not Packed
SHA256	74fbb7885ee486028fe2723f95911474b771f361b2b40ddb77c46f252059c696
MD5	ab6a985dbef013596ac79ca5117ef77c
ImpHASH	9b9e1545a27f74c7e825990e6d713212

The screenshot displays a debugger's string table with the following entries:

- u_Trend_Micro_1400db598**: unicode "Trend Micro" (XREF[1]: 140001a24(*))
- u_ProgramData_1400db5b0**: unicode "ProgramData" (XREF[1]: 140001a4d(*))
- u_.msi_1400db5c8**: unicode ".msi" (XREF[1]: 140001b94(*))
- u_System_Volume_Information_1400db540**: unicode "System Volume Information" (XREF[1]: 1400019b2(*))
- u_.exe_1400db578**: unicode ".exe" (XREF[1]: 140001ade(*))
- u_.dll_1400db588**: unicode ".dll" (XREF[1]: 140001b07(*))

A filter is applied to the string table, showing only strings starting with ".lnk". The filtered entry is:

Location	String Value	String Repres...	Data Type
1400db5f0	.lnk	u".lnk"	unicode

Analysis I

During the static analysis process, it was found that akira ransomware contains an exclusion list for some files and folders. The files and directories that Akira Ransomware does not encrypt are as follows:

Folders Excluded by Akira Ransomware:

System Volume Information, Boot, \$Recycle.Bin, Winnt, \$RECYCLE.BIN, Windows, Trend Micro, Temp, Thumb

Files Excluded by Akira Ransomware:

.msi, .sys, .dll, .lnk, akira_readme.txt, .exe

Akira Ransomware is observed to encrypt all other data on the system.

Analysis II

In the analyzed ransomware sample, it was determined that system backups were deleted at the rst stage with the **Get-WmiObject Win32_Shadowcopy | Remove-WmiObject** command via PowerShell

Detected Powershell Command:

Get-WmiObject Win32_Shadowcopy | Remove-WmiObject

```
00007FF9A0C97900 <advapi32.CryptGenRandom>
jmp qword ptr ds:[7FF9A0D280C8]
```

Analysis III

Akira Ransomware has been found to use the CryptGenRandom() function in its execution process. This function is used to generate random number data and is used by Akira Ransomware for key generation.

```

114 FUN_14008d624();
115 }
116 return;
117 }
```

Analysis IV

The IsDebuggerPresent() API has been detected in the code structure of Akira Ransomware. This indicates that the ransomware checks the debugger on the system it is running on.

746 pcVar3 = (code *)sw1(3);
747 (*pcVar3)();
748 return;
749 }
```

Analysis V

Within the code structure and execution structure of Akira Ransomware, it is observed that APIs such as `GetSystemInfo()`, `DeviceIOControls()`, `NtQuerySystemInformation()` are used to control system properties. In particular, when the code structure including the `GetSystemInfo` API detected on Ghidra is analyzed, it is determined that it checks the system it is run on does not show an anomaly and terminates itself in case of an anomaly. Other APIs detected on x32dbg show virtual machine detection feature.

Detected Encryption Algorithms:

The screenshot displays a debugger window with two panes. The left pane shows assembly code for the function `KeyExpansionFunction`. The right pane shows the decompiled C++ code for the same function. Red boxes highlight specific lines in both panes that relate to key expansion.

Assembly View (Left):

- Line 140084012: `LEA R9, [s_expand_32-byte_kexpand_16-byte_k_1400ce7...` (highlighted with a red box)
- Line 140084019: `MOV dword ptr [param_1 + 0x10], EAX`
- Line 14008401c: `MOV R10, param_1`
- Line 14008401f: `MOV EAX, dword ptr [param_2 + 0x4]`

- Line 25: `param_1[1] = *(undefined4 *)(((longlong)pcVar2 + 4));`
- Line 26: `param_1[2] = *(undefined4 *)(((longlong)pcVar2 + 8));`

Analysis VI

It has been found that the ChaCha algorithm is used to encrypt les in the static code structure of Akira Ransomware. It was also observed that the symmetric key generated during the dynamic analysis process was encrypted with RSA 4096.

TTPs for Akira Ransomware Group

Tactic	Technique	Technique ID	Description
Initial Access	Phishing: Spear Phishing Attachment	T1566.001	Uses phishing emails with malicious attachments to gain initial access to target networks.
	Exploit Public-Facing Applications	T1190	Exploits vulnerabilities in internet-facing applications, such as VPN services without MFA or unpatched systems.
Execution	User Execution: Malicious File	T1204.002	Relies on victims executing malicious files delivered via email or compromised systems.
Persistence	Valid Accounts	T1078	Uses stolen credentials to maintain access within victim networks.
Privilege Escalation	OS Credential Dumping	T1003	Utilizes tools like Mimikatz and LaZagne to dump credentials and escalate privileges.
	OS Credential Dumping: LSASS Memory	T1003.001	Akira threat actors attempt to access credential material stored in the process memory of the LSASS.

Defense Evasion	Obfuscated Files or Information	T1027	Uses encrypted or obfuscated payloads to bypass detection.
	Indicator Removal on Host	T1070	Deletes logs and other artifacts to remove evidence of activities.
	Proxy: External Proxy	T1090.002	Uses external proxies to obscure command-and-control traffic.
Credential Access	Credential Dumping	T1003.001	Dumps credentials from memory or the security accounts manager (SAM) database.
Discovery	Network Service Scanning	T1046	Scans for active systems and services in the network using tools like SoftPerfect Network Scanner.
	System Network Configuration Discovery	T1016	Akira threat actors use tools to scan systems and identify services running on remote hosts and local network infrastructure.
	Domain Trust Discovery	T1482	Akira threat actors use the net Windows command to enumerate domain information.

	Permission Groups Discovery: Local Groups	T1069.001	Akira threat actors use the net localgroup /dom to find local system groups and permission settings.
	Create Account: Domain Account	T1136.002	Akira threat actors attempt to abuse the functions of domain controllers by creating new domain accounts to establish persistence.
Lateral Movement	Remote Services: SMB/Windows Admin Shares	T1021.002	Moves laterally across the network via SMB or admin shares.
	Exploitation of Remote Services	T1210	Exploits vulnerabilities in services such as VMware ESXi for lateral movement.
Collection	Archive Collected Data: Compress Data for Exfiltration	T1560.001	Uses tools like WinRAR to compress data before exfiltration.
Exfiltration	Exfiltration Over Web Service	T1567.002	Uses cloud-based tools like Rclone to transfer stolen data to attacker-controlled infrastructure.
	Exfiltration Over Alternative Protocol	T1048.002	Transfers data using alternative protocols to evade detection.

Command and Control	Remote Access Software	T1219	Akira threat actors use legitimate desktop support software like AnyDesk to obtain remote access to victim systems.
	Proxy	T1090	Akira threat actors utilized Ngrok to create a secure tunnel to servers that aided in exfiltration of data.
Impact	Date Encrypted for Impact	T1486	Akira threat actors encrypt data on target systems to interrupt availability to system and network resources.
	Inhibit System Recovery	T1490	Akira threat actors delete volume shadow copies on Windows systems.
	Financial Theft	T1657	Akira threat actors use a double-extortion model for financial gain.

Akira's sophisticated attack chain, emphasizing their focus on persistence, lateral movement, and data exfiltration to maximize impact on victims.

Akira Ransomware Group: Conclusion and Key Insights

The Akira ransomware group has emerged as a sophisticated cybercrime organization that has demonstrated a growing capability to target organizations across multiple sectors globally. The following is a detailed analysis and conclusion based on the provided report:

1. Overview and Characteristics of Akira Group

- **Emergence:** Akira ransomware group was first identified in March 2023 and has been rapidly evolving since.
- **Primary Motive:** The group's primary goal is financial extortion, with ransom demands ranging from \$200,000 to \$4 million.
- **Target Sectors:** Akira has predominantly targeted organizations in healthcare, finance, education, manufacturing, and critical infrastructure. Specific emphasis has been placed on financial services and government entities in countries like the United States, Canada, and Ecuador.
- **Geographical Reach:** While its operations are global, notable attacks have been concentrated in North and South America, Europe, and select regions in Africa.

2. Attack Methodology

- **Double-Extortion Model:** The group encrypts data and exfiltrates sensitive information, threatening to publish the data if the ransom is not paid.
 - Earlier ransomware variants appended the ".akira" extension, but later versions, such as "megazord.exe," appended ".powerranges."
- **Ransom Notes:** The ransom notes like "akira_readme.txt" share similarities with Conti ransomware, suggesting overlaps in techniques or source code.

3. Sophisticated Techniques

- **Initial Access:** Akira relies on phishing campaigns and exploiting public-facing vulnerabilities in systems like VPNs and unpatched servers.
 - Notable CVEs: CVE-2023-20269, CVE-2022-40684, CVE-2024-40766.
- **Lateral Movement:** The group exploits vulnerabilities such as CVE-2024-40711 and CVE-2023-27532 to expand access within networks.
- **Persistence:** Tools such as AnyDesk, Ngrok, and advanced credential dumping techniques like Mimikatz and LaZagne are employed.
- **Data Exfiltration:** Using tools like RClone and WinSCP, Akira transfers exfiltrated data to attacker-controlled infrastructure before encryption.

4. Tools and Malware

- Akira uses a diverse set of tools, categorized for specific purposes:
 - **Discovery:** Masscan, SoftPerfect Network Scanner.
 - **Credential Theft:** DonPAPI, LaZagne, Mimikatz.
 - **Exfiltration:** RClone, WinSCP, OpenSSH.
 - **Networking:** Cloudflared, Ngrok, and Temp[.]sh for creating secure tunnels.
 - **Defense Evasion:** Zemana Anti-Rootkit, PowerTool.
- Notably, Akira has leveraged both off-the-shelf tools and custom malware like “megazord.exe” and “akira_v2.exe” to enhance its attack capabilities.

5. Exploited Vulnerabilities

- Akira actively exploits a range of high-severity vulnerabilities in software from major vendors, which demonstrates their technical proficiency:
 - **Cisco ASA & FTD:** CVE-2023-20269, CVE-2020-3259.
 - **Fortinet FortiOS:** CVE-2022-40684, CVE-2019-6693.
 - **Veeam Backup & Replication:** CVE-2024-40711, CVE-2023-27532.
 - **VMware ESXi & vSphere Client:** CVE-2024-37085, CVE-2021-21972.
 - **SonicWall SonicOS SSL-VPN:** CVE-2024-40766.
- By leveraging both older and newly discovered vulnerabilities, Akira showcases its ability to adapt its techniques based on evolving security landscapes.

6. TTPs (Tactics, Techniques, and Procedures)

- Akira’s attack methodology aligns closely with the MITRE ATT&CK framework. Some key tactics include:
 - **Initial Access:** Spear-phishing (T1566.001), exploiting public-facing applications (T1190).
 - **Execution:** Malicious file execution (T1204.002).
 - **Persistence:** Using valid accounts (T1078) and creating domain accounts (T1136.002).
 - **Lateral Movement:** Exploiting remote services (T1210), leveraging SMB/Windows Admin Shares (T1021.002).
 - **Exfiltration:** Compressing data for exfiltration (T1560.001), transferring over web services (T1567.002).
 - **Impact:** Encrypting data for impact (T1486), inhibiting system recovery (T1490).

7.Latest Attacks

- The report highlights Akira’s global impact, with attacks on organizations in the United States, Brazil, Italy, and Poland, among others. Noteworthy incidents include:
 - **Xtrim TVCable (Ecuador, Nov 2024):** Akira leaked sensitive financial and customer data after ransom negotiations failed.
 - **Cipla (South Africa):** Akira targeted this healthcare provider, disrupting critical services.
 - **Great Plains Bank (United States):** A financial institution attack emphasizing Akira’s focus on high-value targets.

Mitigations, Defense Recommendations and Risk Analysis Table

Risk Analysis Table:

Risk Factor	Likelihood	Impact	Descriptions
System infiltration	High	High	Exploitation of vulnerabilities in remote access services and stolen credentials.
Data encryption and loss	Critical	High	Encryption of files using the ChaCha and RSA algorithms and deletion of backups.
Data theft and exposure	Critical	High	Theft of sensitive data with threats of selling or leaking the information.
Operational disruption	High	High	Blocking access to critical systems and data, halting business processes.
Double extortion	High	High	Demand for ransom with the threat of data leakage or sale on the dark web.
Debugger and virtual machine evasion	High	Low	Detection of debugging tools and virtual machine environments to avoid analysis.
Targeted attack on key industries	Critical	Critical	Targeting industries like healthcare, IT, and finance for maximum impact.
Phishing	High	High	Delivery of malicious links or attachments to employees, leading to credential theft or malware execution.

Mitigation Strategies:

Risk	Mitigation Strategy
System infiltration	- Implement multi-factor authentication (MFA). - Regularly update and patch software. - Use robust VPN configurations.
Data encryption and loss	- Maintain secure and offline backups. - Implement endpoint detection and response (EDR) solutions.
Data theft and exposure	- Employ network segmentation to limit access. - Use data loss prevention (DLP) tools.
Operational disruption	- Develop and regularly test an incident response plan. - Use redundant systems to ensure business continuity.
Double extortion	- Avoid direct negotiation with threat actors. - Notify law enforcement and cyber insurance providers.
Debugger and virtual machine evasion	- Use behavior-based monitoring tools.
Targeted attack on key industries	- Conduct regular cybersecurity training for employees. - Perform frequent risk assessments and penetration tests.
Phishing	- Conduct phishing awareness training, implement email filtering, and deploying attachment scanning solutions..

Additional Mitigation Strategies Against Ransomware Attacks:

- Implement application whitelisting to prevent unauthorized or malicious software from running on your systems by only allowing approved programs to run.
- Integrate ThreatMon ThreatFeed into your security products, providing information about emerging ransomware threats.
- Use ThreatMon's News section and ThreatMon AI to set early warning alerts for ransomware campaigns targeting your industry or region. These alerts can help your organization prepare for potential attacks before they reach you.
- Ensure data is backed up regularly and maintain multiple copies, one offline or on a cloud service.
